Product Description

Organic Intermediates CAS 50-27-1 Estriol Pharmaceutical raw materials

Estriol is a natural hormone, a metabolite of estradiol in the body, mainly found in urine. The oral activity is about 6 times that of estrone, but it is weaker than estradiol and has no carcinogenic effect. The level of estradiol in the body does not change after taking the drug. Estriol has a selective effect on the cervical canal, but has no effect on the uterine body and endometrium.

1. Estriol can be used for treating cervicitis and especially suitable for treating menopausal syndrome and senile vaginitis.
2. Estriol can also be used as the adjuvant drug for middle-term labor induction and artificial abortion.
3. It can also be used for treating prostatic hypertrophy and prostate cancer.
4. Estriol still has a rapid role in increasing the peripheral leukocytes. It generally takes effect at 1 to 3 days after the treatment but with a short duration period. It also has efficacy in treating leukopenia caused by chemotherapy or radiotherapy.
5. Estriol can be used for reducing the vascular permeability and fragility and can be used for the treatment of various kinds of hemorrhage. It also has quick hemostasis effect on menorrhagia, hysterectomy or tonsillectomy.
