Product Description

L-Lysine, L-prolyl-L-methionyl- Cas 1314093-06-5 Protein Structure Stabilization

L-Lysine, L-prolyl-L-methionyl- is a peptide or dipeptide composed of three amino acids: L-lysine, L-proline, and L-methionine. L-lysine is an essential amino acid that plays a crucial role in protein synthesis and is important for growth and tissue repair. It is characterized by its side chain containing a positively charged amino group (NH₃⁺) at the end.

L-proline is a non-essential amino acid that is known for its unique cyclic structure. It is involved in collagen formation, protein structure stabilization, and plays a role in cellular signaling pathways.

L-methionine is an essential amino acid that contains a sulfur atom in its side chain. It is involved in protein synthesis, methylation reactions, and is a precursor for various important molecules in the body.

When combined together, L-lysine, L-proline, and L-methionine form a dipeptide, with L-proline followed by L-methionine attached to the amino group of L-lysine. This dipeptide may have specific biological functions or properties associated with the individual amino acids and their arrangement in the sequence.
