Product Description

99% 41294-56-8 Alfacalcidol Suitable For the Treatment Of Rickets

Teriparatide acetate is a medication that is primarily used for the treatment of osteoporosis. It belongs to a class of drugs called parathyroid hormone analogues. Teriparatide acetate is a synthetic version of human parathyroid hormone, specifically its active fragment. It works by stimulating bone formation and increasing bone density, which helps to strengthen bones and reduce the risk of fractures.

Teriparatide acetate is administered through daily subcutaneous injections. It is typically prescribed for individuals who are at high risk of fractures or have not responded well to other osteoporosis treatments. The medication is usually used for a limited duration, typically up to two years, due to potential safety concerns associated with long-term use.

Common side effects of teriparatide acetate may include nausea, dizziness, leg cramps, and injection site reactions. It is important to follow the prescribed dosage and administration instructions provided by a healthcare professional when using this medication.

As with any medication, it is important to discuss potential risks and benefits with a healthcare provider before starting teriparatide acetate. They can provide personalized advice and guidance based on an individual's specific medical history and circumstances.
