## Product Description

### Professional Supply API 99% Dapagliflozin CAS 461432-26-8 for Diabetes

Dapagliflozin is a medication used to treat type 2 diabetes. It belongs to a class of drugs known as sodium-glucose co-transporter 2 (SGLT2) inhibitors.

Dapagliflozin works by blocking the reabsorption of glucose by the kidneys, which leads to increased glucose excretion in the urine. By reducing the amount of glucose reabsorbed, dapagliflozin helps lower blood sugar levels in individuals with type 2 diabetes.

In addition to its blood sugar-lowering effects, dapagliflozin has also been found to have other benefits. It can help promote weight loss and reduce blood pressure in individuals with diabetes. This is because the increased excretion of glucose in the urine also leads to the loss of calories and excess fluid from the body.

Dapagliflozin is typically taken orally, usually once a day. It can be used alone or in combination with other diabetes medications, such as metformin or insulin. The dosage prescribed may vary depending on individual factors and the specific treatment plan determined by a healthcare provider.
