Product Description

summarize

Adrenalin, also known as pararenin, pararenin, is extracted from the adrenal medulla of domestic animals (cattle, sheep) or synthesized by artificial methods, is white or white crystalline powder, and has an exciting effect on α and β receptors. Adrenaline is a hormone secreted by chromaffin cells in the adrenal medulla. It is mainly involved in sympathetic nervous system regulation. When its secretion increases, it causes increased cardiac activity - increased heart rate, increased cardiac output, and increased blood pressure; Liver glycogen decomposition into glucose increases blood sugar, fat decomposition accelerates and metabolism enhances. Bronchial smooth muscle relaxation, etc. The sympathetic nervous system is significantly enhanced when the environment changes dramatically, intense exercise, tension, fear, cold, massive blood loss, etc., and the secretion of adrenal medulla also increases, and the content of adrenaline in the body increases. When adrenaline acts on adrenergic receptors (α , β adrenergic receptors), it causes a series of changes in body activity and metabolism. Of the hormones secreted by the adrenal medulla when the sympathetic nerve is excited, 80% are adrenaline and 20% are norepinephrine
